Auto Ticket Classification using Flow Designer

Date	07 October 2026	Team ID	SWTID-2026-6524
Project Name	Auto Ticket Classification using Flow Designer	Maximum Marks	4 Marks

1. Purpose of Document

This document describes the test coverage and open issues of the Auto Ticket Classification using Flow Designer project at the time of release to User Acceptance Testing (UAT). The solution automatically assigns Category and Subcategory to school IT helpdesk tickets by evaluating keywords in the Short Description, and sends a confirmation email to the caller. Testing covered the following stages of the workflow:

Stage	Focus of Testing
Configuration	Custom table (Incident WorkFlow), fields, choice lists and auto-numbering.
Dependency	Category-to-Subcategory dependent choice logic.
Automation	Flow Designer trigger (Record Created, Category is empty) and keyword-based If / Else If classification.
Notification	Send Email action to the caller and verification in System Logs > Emails.
Validation	Mandatory fields, auto-number uniqueness, reference fields and access control.

2. Defect Analysis

The table below shows the defects identified during UAT and their current resolution status, grouped by severity (Severity 1 is the most critical).

Resolution	Severity 1	Severity 2	Severity 3	Severity 4	Subtotal
By Design	0	0	1	0	1
Duplicate	0	0	1	0	1
External	0	0	0	0	0
Fixed	0	1	1	1	3
Not Reproduced	0	0	0	0	0
Skipped	0	0	0	0	0
Won't Fix	0	0	0	0	0
Totals	0	1	3	1	5

Of the 5 defects logged, 3 were fixed, 1 was by design and 1 was a duplicate. No Severity 1 defects were raised. The Severity 2 defect (Subcategory list not filtering by Category) was fixed by setting the dependent value on each Subcategory choice.

3. Test Case Analysis

The table below shows the number of test cases that passed, failed and remain untested for each major functional area of the Flow Designer automation.

Section	Total Cases	Not Tested	Fail	Pass	Pass Rate
Custom Table & Form Configuration	4	0	0	4	100%
Field & Choice Configuration	4	0	0	4	100%
Dependent Choice (Category / Subcategory)	4	0	0	4	100%
Flow Trigger Configuration	3	0	0	3	100%
Keyword Classification (Wi-Fi, Projector, Password, Slow)	6	0	1	5	83.3%
Email Notification	4	0	0	4	100%
Data Validation	3	0	0	3	100%
Security / Access Control	2	0	0	2	100%
Total	30	0	1	29	96.7%

UAT Summary: The automation was tested across table setup, field and choice configuration, dependent choices, flow trigger, keyword classification, email notification, validation and access control. Most planned test cases passed; one Keyword Classification case (a ticket written with a spelling variant of the Wi-Fi keyword) did not match any If condition and requires correction before final acceptance.

4. Exception Reporting

Exception / Issue	Status	Action
Short Description uses a keyword variant not defined in the flow (e.g. 'WiFi' vs 'Wi-Fi')	OPEN	Add OR condition sets for keyword variants in the If / Else If blocks.
Subcategory list not filtered by selected Category	RESOLVED	Verify Dependent field and Dependent value on each choice.
Email not sent to caller	RESOLVED	Verify caller has an Email value and check System Logs > Emails.
Typo in choice / keyword labels (Slow Compter, Prajector)	RESOLVED	Correct the label and keyword text; re-test.

5. Final Report Output

The final UAT output confirms that the Auto Ticket Classification flow triggers on ticket creation, evaluates the Short Description, assigns the correct Category and Subcategory, and sends a confirmation email to the caller.

Metric	Result	Metric	Result
Total UAT Test Cases	30	Not Tested	0
Passed	29	Open Issues	1
Failed	1	Pass Rate (29 / 30)	96.7%

6. Version Control

Version	Date	Description
1.0	07 October 2026	Initial UAT report for Auto Ticket Classification using Flow Designer.
